ESSAY: SOCIAL MEDIA PLATFORMS INSTAGRAM VS FACEBOOK

Introduction:

"Instagram vs. Facebook" is an interesting topic that covers diverse perspectives regarding both platforms. Have you ever wondered about the roots of these platforms among the people? No? Then let's explore this. Our essay will cover opinions illustrated in the Venn diagram created from the data collected via a form, that will discuss potential differences and similarities between both platform.

Different users provided various opinions on the algorithm effectiveness of both platforms, their security features, and user preferences. These points will be effectively integrated into the later parts of the essay.

Body Paragraph 1:

Firstly, have you ever had a curiosity to search which platform is well structured in terms of engagement? No? That's okay, let's dive in. According to the analysis after collecting information from diverse people, we found that Instagram is more user-friendly and offers integrated and useful benefits. For example, respondents were asked about which platform they would prefer, many answered Instagram as it's visually appealing and connecting to friends and family is easier. Instagram engagement rate is 0.54% for all posts, outperforming Facebook's 0.07%. This shows Instagram's ability to connect with users, especially the youth through pictures and videos. Moreover, after getting responses around 60% of respondents agreed that Instagram's content is more effective, with 30% reflecting high user trust. When getting responses we also got to know that 84.6% say that they get more connected with their friends, and family as compared to Instagram. However, Facebook also has its strengths like long-form content

(blogs) and personal updates that we can outline from our form where 76.9% agreed with this fact. Since both platforms serve different purposes , but Instagram is great for trends and visual content, while Facebook is better for sharing detailed posts and building lasting connections through its Marketplace.

Body Paragraph 2 :

Secondly, have you ever heard that Instagram and Facebook have such security features that can preserve your data? No! So leading this topic, we will move to a very dense part in the topic where we have to discuss security features being provided by both platforms that will be quite interactive. According to our data collection, we found that on our question that "Instagram is more suitable in terms of privacy of user," we got diverse responses that suggest that 35% think it provides security features, the other 45% think that it doesn't provide security features, and the remaining 20% remained neutral. We can also fact-check that according to a survey been held among 15 diverse platforms, results showed that Instagram was on 13th place in terms of security, and on 15th Facebook was present, which represents different perspectives. But despite this, we get to know that Instagram and Facebook have installed different built-in integrated software to prioritise user's security, and if in an urgent case a user loses his data, then they can give a history of 3 months of data. Also, Instagram provides different features, like giving the option to make their account private according to their priority; it also encrypts data and uses different firewalls and hard security features to prevent access to unauthorised people that is illustrated in our venn diagram.

Body Paragraph 3 : (Algorithm, content discovery)

Lastly, we will discuss how efficient in contrast both platforms algorithms are. In Instagram, according to our findings, it was preferred more as our form question, where we asked which is better; there we can get to know that 58.3% of people preferred Instagram content and algorithm more efficiently as they can watch their favourite topic information. Also in terms of content discovery, Instagram and Facebook were approximately ranked the same according to our finding, where we could get to a conclusion that 80% agreed but nearly 5% disagreed with the fact regarding Instagram algorithm effectiveness .Also for example, Instagram

is a platform that is more suitable in terms of business , advertisement From where we can find that in terms of both platforms,50% agreed,35% disagreed, this tells how they are equally connecting themselves with most people.

Conclusion

Overall we reached different facts and findings regarding comparison of both platforms. We firstly discussed the overall engagement ratio of people with these platforms. Secondly, we overviewed some facts on security, algorithms, and which platform suits it, and lastly we also highlighted user perspectives on this topic. Summing our topic our venn diagram illustrates how both platform has varying advantages, benefits to user. We discussed the potential similarities between the two platform's plus the potential differences in them according to user responses illustrated below.
