TYPES OF RELATIONSHIP :

1. ONE TO ONE:

This table highlights that there are 2 tables to develop a one to one relationship the primary key need to be the same in both tables as above this will help to develop a one to one relationship.

2. ONE TO MANY

This tells that there are 2 tables one courses and other enrollements there we can see in courses table there is a primary key named as courseid that is used as a foreign key in another table that establish one to many relationship.

3. MANY TO MANY :

Here we can focus that three tables named sports unique id s , students, enrollements here we can see that two primary key of both table are used as foreign key in third table named sports unique id that represents many to many function.

HOW TO DEVELOP RELATIONS :

STEP 1: first we open our access on which our data is placed :

STEP 2: After opening we click on Data Base Tools and click on relationship :

STEP 3 : Click to add tables for which relationship is to be made :

Step 4 : ADD TABLES :

STEP 5 : NOW BUILT RELATIONSHIPS :

STEP 6 : DISPLAY RELATION SHIPS :

IMPORTANCE OF REFERENTIAL INTEGRITY :

- 1).** Referential integrity ensures that table donot try to refer any data which don't exist.
- 2).**Also referential integrity ensures that the primary key cannot be deleted until all dependent records are deleted meaning cascading delete.
- 3).** Also referential integrity ensures that the primary key cannot be updated until all dependent records are updated meaning cascading edit/update.
- 4).** Also it ensures that every foreign key has a corresponding values of primary key.
- 5).** It prevents access of unauthorized users.
- 6).**Also it allows complex queries to be easily joined this helps to make accurate relationship.
